To provide a fair cost per litre comparison for the top nutrient brands, we used the following methodology. Using the brand's feed schedule or nutrient calculator (from their website), we determined total recommended usage for each product based upon a 9 week bloom phase for a 100 litre weekly feed. Then using published RRP pricing (as of February 1st, 2019), we calculated the cost per millilitre of each product for appropriate packaging size, rounded to the nearest whole cent. Multiplying these two numbers gave us the cost per litre for each product. Adding all products together gave us the number published here. This cost comparison is intended only to provide perspective on relative costs of nutrient brands. Actual numbers may vary slightly depending on light or aggressive feeding, packaging size purchased, actual purchase price, etc.
